Homework Assignment: Build a Dynamic Website using HTML, CSS, JavaScript, Bootstrap, PHP, and MySQL

Objective:
To create a dynamic, responsive, and feature-rich website that demonstrates your proficiency in HTML, CSS, JavaScript, Bootstrap, PHP, and MySQL. The website will be a Student Registration System that allows users to perform CRUD operations (Create, Read, Update, Delete) on student records, with additional advanced features such as user authentication, search functionality, pagination, and AJAX form validation.

Requirements:

1. User Authentication (Login/Logout System)

- User Registration: Users should be able to register an account with a username, email, and password.
- Login System: Allow registered users to log in using their credentials (username/email and password).
- Logout System: Provide a logout option to log out of the session.
- Password Hashing: Use PHP's `password_hash()` and `password_verify()` functions for secure password handling.
- Session Management: Use PHP sessions to keep track of logged-in users and secure pages.

2. CRUD Operations for Student Records

- Add Student: Form to add new students, including fields for name, email, phone number, address, and an optional profile picture upload.
- View Students: Display a list of all students, with features for sorting, searching, and pagination.
- Update Student: Allow users to update student records, including name, email, phone number, and address.

- Delete Student: Provide a delete option for students, with confirmation prompts before deletion.

3. Advanced Features

1. File Uploads: Allow users to upload profile pictures for students during registration. The image should be stored on the server, and a reference to the image should be saved in the database.

2. Search Functionality: Implement a search bar to filter students by name, email, or phone number.

3. Pagination: When viewing students, display them in pages (e.g., 10 students per page). This will require both server-side and client-side handling.

4. AJAX Form Validation: Validate forms (e.g., the Add Student form) using AJAX to check for input errors (e.g., empty fields, invalid email) without reloading the page.

5. Responsive Design: Ensure the website works on both desktop and mobile devices, using Bootstrap's grid system and components.

Project Breakdown:

1. Database Setup (MySQL)

- Create a database `student_registration_system` and a table `students` with the following fields:
  - `id` (INT, AUTO_INCREMENT, PRIMARY KEY)
  - `name` (VARCHAR(100))
  - `email` (VARCHAR(100))
  - `phone` (VARCHAR(15))

- `address` (TEXT)
- `profile_picture` (VARCHAR(255), optional)
- `created_at` (TIMESTAMP)

- User Table for authentication:
- `id` (INT, AUTO_INCREMENT, PRIMARY KEY)
- `username` (VARCHAR(100), UNIQUE)
- `email` (VARCHAR(100), UNIQUE)
- `password` (VARCHAR(255)) — password hash stored here
- `created_at` (TIMESTAMP)

2. Frontend Development (HTML, CSS, Bootstrap, JavaScript)

- Homepage (`index.html`):
  - Display a welcome message and links to Login, Register, Add Student, View Students, etc.

- Login Page (`login.html`):
  - A form to log in using email/username and password.
  - Include error messages for failed login attempts.

- Registration Page (`register.html`):
  - A form for new users to create an account.
  - Include input fields for username, email, and password.
  - Implement password confirmation and validation.

- Add Student Page (`add_student.php`):
  - A form to add a student, including fields for name, email, phone number, address, and an optional profile picture upload.
  - Use AJAX for real-time form validation (e.g., check if the email is valid or if the fields are empty).

- View Students Page (`view_students.php`):
  - Display a list of all students.

- Include a search bar to filter students by name, email, or phone.
- Implement pagination (e.g., 10 students per page).
- Provide edit and delete options for each student.

- Update Student Page (`update_student.php`):
- Pre-fill a form with the student's current data for updating.
- Allow the option to update the profile picture.

- Delete Student (`delete_student.php`):
- Provide a delete option with a confirmation prompt.

3. Backend Development (PHP)

- User Authentication:
- register.php: Handle new user registrations (insert data into the `users` table).
- login.php: Handle user login, validate credentials, and start a session.
- logout.php: Log the user out by destroying the session.

- Student Management (CRUD):
- add_student.php: Handle form submission to insert a new student into the database, including file upload handling.
- view_students.php: Fetch students from the database with pagination, sorting, and search capabilities.
- update_student.php: Handle student record updates.
- delete_student.php: Handle student record deletion.

- Database Interaction:
- Use PDO or MySQLi to interact with the MySQL database for fetching, inserting, updating, and deleting data.

4. Advanced Features

1. File Uploads:

- Handle file uploads (profile pictures) using PHP's `move_uploaded_file()` function. Store the image in a directory and save the file path in the database.

2. Search Functionality:
- Use a simple SQL `LIKE` query to search students based on their name, email, or phone number.

3. AJAX Validation:
- Use AJAX for real-time validation of the Add Student form. Ensure all fields are filled and validate the email format.

4. Pagination:
- Use PHP and SQL to fetch and display a limited number of students per page (e.g., 10 per page).
- Display previous and next buttons for pagination.

5. Styling and Responsiveness (CSS, Bootstrap)

- Use Bootstrap 5 to create a responsive layout using the grid system.
- Style forms, buttons, tables, and other components using Bootstrap.
- Ensure the website is fully responsive, adjusting well for both desktop and mobile views.

Deliverables:

1. Website Files:
- HTML, CSS, PHP, and JavaScript files.
- SQL file for creating the database and tables.

2. Documentation:
- README file explaining:
  - How to set up the database and configure the project.

- Instructions for running the website on a local server (e.g., XAMPP, WAMP).
- How to use the website, including user registration and login, adding/viewing/updating/deleting students.

3. Screenshots:
- Screenshots of the website, demonstrating the student registration, viewing, updating, and deletion functionality.

4. Code Explanation:
- Provide a brief explanation of how each feature works (e.g., how the search and pagination system works, how the AJAX validation is handled, how file uploads are processed).

Grading Criteria:

1. Functionality:
- Does the website allow users to register, log in, and manage student records (CRUD operations)?
- Is the file upload system working correctly?

2. Design and Responsiveness:
- Is the website visually appealing and easy to navigate?
- Does the website work well on mobile and desktop devices?

3. Code Quality:
- Is the

code clean, well-organized, and easy to understand?
- Are best practices used for security (e.g., password hashing, SQL injection prevention)?

4. Advanced Features:
- Is the AJAX form validation functional?

- Does the website have search and pagination working smoothly?

5. MySQL Database:
   - Is the database properly structured and connected?
   - Are CRUD operations functioning correctly?
